Summary

Software Engineer with 4+ years of experience architecting distributed systems and scalable data pipelines. Specializing in platform engineering, ETL architectures, and complex data modeling. Proven track record of designing foundational backend systems, powering critical enterprise GRC modules (Access Review, Vulnerability Management, Automated Evidence) that drive direct revenue and automate hundreds of hours of manual audit workflows.

Education

B.Tech, Computer Science (7.86/10) | Indian Institute of Information Technology, Nagpur | 2018 – 2022

Skills

- **Languages:** Python, JavaScript, TypeScript, C++
- **Backend & Cloud:** Node.js, PostgreSQL (Graph Data Modeling), MongoDB, RabbitMQ, AWS.
- **Architecture:** ETL Pipelines, Multi-tenant Systems, API Rate Limiting, Distributed Systems

Experience

Scrut Automation | *Software Development Engineer (Full Stack)* | Remote | Mar 2024 – Present

- **Platform Architecture (datasync-slave):** Architected the foundational data synchronization engine powering multiple core GRC modules (Monitors, Access Review, Vulnerability Management, Continuous Autonomous Test, Asset Management). Built a queue-driven ETL pipeline with a dependency graph execution model to seamlessly process data across 40+ third-party integrations supporting multi-tenant data architecture using PostgreSQL graph model (entity/relationship tables) for deep-hierarchy recursive traversal.
- **Automated User Access Review (UAR):** Engineered the UAR infrastructure to centralize cross-application identity management and automate periodic access certifications. Replaced error-prone spreadsheet reviews with real-time API synchronization, 1-click verification, and 100% audit-ready reporting. This directly mitigated security risks, slashed administrative burdens, and fulfilled rigorous SOC 2/ISO 27001 controls to unlock **\$100k+** in enterprise contracts.
- **Automated Evidence & Authenticity:** Built the Automated Evidence Collection tool (Scrut Monitor) pipeline generating reports at regular intervals along with source of truth of the data attached, eliminating manual data gathering by automatically pulling data from integrations and acting as a pillar for evidence collection module.
- **Risk-Based Vulnerability Management:** Designed the vulnerability tracking infrastructure by syncing critical threat data from external scanners (AWS Inspector, Snyk, GitHub Dependabot). Developed automated risk-scoring and remediation SLA tracking pipelines, empowering security teams to prioritize critical CVEs and maintain continuous compliance.

PropReturns | *Founding Full Stack Engineer* | Jun 2022 – March 2024

- **Process Automation:** Built a bidirectional Python and gspread synchronization pipeline between Google Sheets and MongoDB, eliminating manual data entry bottlenecks and reducing property upload times by **90%**.
- **Security & Auth:** Implemented robust Role-Based Access Control (RBAC) via Node.js and OAuth 2.0, scaling the architecture to enforce granular, user-level permissions for highly sensitive financial data.

Siemens Healthineers | *Software Development Engineer Intern* | Aug 2021 – Dec 2021

- **Data Transformation:** Developed a critical ingestion component converting AI-generated DICOM format results into human-readable FHIR JSON resources, directly enhancing the reliability of Clinical Decision Support Systems.

Projects

[Land Axis](#) | *Supabase, Python, Flask, React* | Dec 2025

- Architected and deployed a full-stack real estate transparency platform [Land Axis](#) that aggregates and visualizes critical land ownership and distribution data for investors.
