Summary

Full Stack Engineer at Scrut Automation, a compliance automation platform. I am passionate about leveraging core engineering fundamentals to design robust and scalable products.

Education

BTech (Computer Science) - Indian Institute of Information Technology, Nagpur, India (7.86/10) 2018-2022

Technical Skills

- **Programming languages** - Python, JavaScript, TypeScript, C++.
 - **Tools and Framework** - Node.js, MongoDB, PostgreSQL, ReactJS, Next.js, AWS, Express, Selenium.
-

Experience

SDE at Scrut Automation (Full Stack Engineer) (March 2024 - Present)

- **Engineered a scalable datasync worker service** for multiple integrations (e.g., AWS, GitHub, Snyk) to automate the ingestion of high-volume data (Repositories, PRs, Commits) into PostgreSQL.
- **Designed a graph-like relational schema in PostgreSQL** to manage complex dependencies between data entities, optimizing query performance for deep-hierarchy datasets without the overhead of a dedicated graph database.
- **Architected a critical Access Review module** that centralized user identity management across applications, **directly enabling the closure of \$100k+ in enterprise contracts** by fulfilling key customer compliance commitments.

SDE at PropReturns (Founding Full Stack Engineer) (June 2022)

- **Reduced property upload time by 90%** by engineering a custom data synchronization pipeline (using Python & gspread), eliminating manual verification steps, and maintaining consistency between Google Sheets and MongoDB.
- **Built a high-performance image processing engine** using Jimp and Sharp libraries on AWS. The solution automates resizing into five distinct formats with watermarking, ensuring optimized load times across web and mobile platforms.
- **Implemented robust Role-Based Access Control (RBAC)** using Node.js and OAuth2.0 to secure sensitive financial data, later scaling the architecture to support **granular user-level permissions**.

SDE Intern at Siemens Healthineers (August 2021-December 2021)

- Created a component that takes AI results as input in [DICOM](#) format and converts them into human-readable JSON format as [FHIR](#) Resources for clinical analysis while working on Clinical Decision Support Systems(CDSS).

SDE Intern at Seekify (Frontend React JS developer) (February 2021-May 2021)

Projects

Automated Bulk Deal Tracking (<https://seven-money.vercel.app/>) (November 2024)

- **Built a real-time data pipeline** to extract bulk deal data from NSE/BSE using Angel One SmartAPI, processing market metrics for immediate analysis.
- **Designed an interactive UI** for visualization, enabling the formulation of data-driven trading strategies that yielded over **15% returns**.

Land Axis (<https://www.landaxis.in/>) (December 2025)

- Developed "**Land Axis**", a real estate transparency platform that aggregates and visualizes critical land ownership and distribution data, empowering investors with granular insights for data-driven decision-making.
-
